Plug-in solar

Use this quick checklist before you buy Plug-in solar

- [ ] Confirm that your state has passed legislation.
- [ ] Shop responsibly with reputable retailers. Consumers should only use systems that are certified by UL or another nationally recognized testing laboratory.
- [ ] Notify your utility or landlord if required. This will vary by state and/or utility.
- [ ] Check your local building codes and neighborhood regulations if you are part of the Homeowners Association, Condo Owners Association, or similar group.
- [ ] Confirm that your electric meter is compatible with plug-in solar.

How Plug-in solar works

A solar panel captures sunlight & generates Direct Current (DC) electricity.

The panel connects to a micro-inverter converting DC power to Alternating Current (AC) electricity.

The micro-inverter plugs into a wall outlet sending the energy into your home.

Your home uses plug-in energy first, reducing the electricity you buy from the utility.
